

Computer Operator Interview Questions

A computer operator is a specialist who monitors and controls computer systems within an organization or a company, providing assistance to a system administrator. Their duties revolve around software and hardware issues, system performance improvement, batch processing control, online availability (as well as all the relevant documentation) maintenance, and assisting staff with computer issues. The rest of computer operator responsibilities may include peripheral equipment maintenance, system backups, and providing customer support.

As a computer operator lands the position, they might be asked to learn IBM's OS/390 or other OS's, apps employed by the company, or local area network operation. In addition, a high school diploma is typically a must for this job. In the most cases, candidates are also expected to possess technical experience or an additional certification. A good computer operator effectively cooperates with each and every team member and can work independently at the same time. Also, such a specialist must demonstrate superb analytical skills and an ability to quickly respond to emergency situations.
